

WOLFARD OPERATING INSTRUCTIONS FOR ARCH LIGHT

Congratulations on owning your new Wolfard Oil lamp. The Arch Light was hand-blown in California's Wine Country region and represents the very finest in craftsmanship and materials. By following these few tips, you'll be able to get maximum enjoyment from your lamp for years and years to come.

Filling: We include a filler spout with each Wolfard Oil Lamp to make filling easy. Simply attach the filler spout to your lamp oil bottle (it's designed to fit most standard one-quart oil bottles). Hold the Arch Light at an angle. Insert the flexible tip of the filler spout into the opening in the top of the reservoir. Take care not to fill more than $\frac{1}{4}$ " from the top, otherwise, oil may overflow when the wickholder is inserted. Insert the wickholder and wait for several minutes to allow the wick to fully absorb the lamp oil before lighting.

Lighting: The easiest way to light your Wolfard Lamp is with a long fireplace match or butane fireplace lighter. Just avoid tilting the lamp during lighting, since this could cause fuel to spill.

Adjusting the Flame: When properly adjusted, your flame should be just about the size and intensity of a candle's. You can adjust the flame by raising or lowering the wick in its glass holder - but be sure to let the wick, wick holder and reservoir cool down before touching!

The top of the wick should be just below the lip of the glass wick holder. If any part of the wick, including threads or frays, protrudes from the top of the holder, your lamp may smoke. During initial use, or when refilling or sampling oils, watch the lamp for approximately 15 minutes to make sure it doesn't smoke. If it does, blow out the flame, allow the lamp to cool, remove the wick holder from the lamp and pull the wick lower down into its holder and repeat the process again, allowing approximately 15 minutes to warm up while checking for smoke.

Choosing Lamp Oil: We recommend Wolfard Lamp Oil because of its clean-burning qualities. If you can't find Wolfard Lamp Oil, any high quality lamp oil including colored or scented oils, will do. Avoid using kerosene or cheap lamp oils, since they tend to smoke and have strong odors. Do not use solvents or fuels with lower ignition points than kerosene – such as alcohol, gasoline, paint thinner, or acetone - these are unsafe!

Cleaning: Because it's made from the finest heat-resistant glass available, your Wolfard Lamp is rugged enough to be cleaned in the dishwasher. For best results, place lamp upside down so the reservoir doesn't fill with soap and water. Just remember that any object made of glass isn't indestructible, so treat your lamp with reasonable care.

Burn Time: The burn time for the Arch Light is approximately 8 hours between refills (since each Wolfard Lamp is handblown, burning times may vary just slightly).

ALWAYS keep out of the reach of children whether lit or not.
NEVER leave any device unattended while lit.
